	Abstract	The Hârtibaciu River in the Al âna area has a disturbed lateral connectivity owing to its lateral embankments, as a result of which fish communities in this river sector are negatively influenced. The method of obtaining the water supply for a new proposed wetland is by gravitation, and any excessive water supply to the wetland will be controlled and directed to the Hârtibaciu River in a natural manner. A state-of-the-art man-made wetland should increase the quality of the habitat for local fish communities, especially for the <i>Rhodeus sericeus</i> population, which is a species of conservation interest.

	Lineage	To evaluate the necessity for the suggested project the fish association structure was researched in the Al âna locality (Sibiu County, Romania) proximity of the river Hârtibaciu. In 2015-2016, a mountain fishing net was used for fishing, in time and effort unit, the captured fish were identified and released back into their habitat at once.
